

Spec [↑]P™ Introduction Letter

Welcome to Our **Spec [↑]P** pages !

Water blasting removal of pavement markings has made great strides in recent years. The great benefit of water blasting for removal of pavement markings is that the water jets can extract marking materials from the pores without reducing the surface height.

The written specifications currently used on most projects do not support the critical elements adequately. The reason is that water blasting removal has not been understood clearly enough at the specifier level. The result is that many in the workforce have been trained and conditioned by a non-workable specification.

The documents we offer on this subject are intended to invite conversations into the project planning to immediately bring clarity and finer results to the owners and contractors.

This subject is best introduced with a comprehensive look at the many areas involved.

As such, these documents are intended to invite conversation while giving an overview of the various sub-topics. You may encounter long sentences or perhaps a typo here and there. We apologize for these if and when they occur. However, the subject merits conversation in order that the specifiers and stakeholders understand the various reasons why this issue is so important.

Writing often seeks efficiency with the shortest most concise statements. However, this is a dynamic topic and requires effective conversations more than efficient presentation.

Please read the pertinent insights and feel free to call to clear up any gaps you may discover in the content !
